

Notes / Questions

LILLITH · NOTES FOR PM

1. Camera heading value

For cameras is live `pan_deg` can be used for the heading value? For now at least?

`heading` value is a fixed value that is supposed to be set in the DB after installation of the camera (not currently found in jupiter DB).

2. Status inconsistency

In the system, the camera statuses are:

Status	Meaning
<code>ACTIVE</code>	Camera connected
<code>INACTIVE</code>	Camera isn't connected OR any fetal connection fail
<code>SEMI_ACTIVE</code>	Connected but there are problems with the connection

In the spec, the statuses are:

- `ACTIVE`
- `INACTIVE`
- `FAIL`
- `BUSY`

3. Footprint data

Can't get footprint data.

4. Sensor type

Sensor type is `EVO` or `PTZ`. Shouldn't it be camera or drone instead?

What is `EVO`?

5. Coverage is not available for every camera

- Live aim readings only exist for cameras on the older control protocol (`AVIV` , `BARKAN` , `NETZ` , `TZUKIT`) and only while that camera is actively connected.
- **ONVIF and KELA cameras never report aim data at all**, so they will have no `coverage` object.

Is it ok?

6. `maxRange_m` source

`maxRange_m` value is gotten currently from the geo server service.

Is it a problem? Should we get the geo server service as part of lillit just for that value?
